

- 1. Who developed Python [Programming](#) Language?**
 - A. Wick van Rossum
 - B. Rasmus Lerdorf
 - C. Guido van Rossum
 - D. Niene Stom

- 2. Which type of Programming does Python support?**
 - A. object-oriented [programming](#)
 - B. structured programming
 - C. functional programming
 - D. all of the mentioned

- 3. Is Python code compiled or interpreted?**
 - A. Python code is both compiled and interpreted
 - B. Python code is neither compiled nor interpreted
 - C. Python code is only compiled
 - D. Python code is only interpreted

- 4. Which of the following is used to define a block of code in Python language?**
 - A. Indentation
 - B. Key
 - C. Brackets
 - D. All of the mentioned

- 5. Which of the following character is used to give single-line comments in Python?**
 - A. //
 - B. #
 - C. !
 - D. /*

6. What is the return type of the input() function in Python?

- A. Integer
- B. Float
- C. String
- D. Boolean

7. Which of the following is the correct way to take an integer as input?

- A. `x = input(int)`
- B. `x = int(input())`
- C. `x = input().int()`
- D. `x = integer(input())`

8. Which of the following is a valid Python variable name?

- A. 2number
- B. class
- C. my_variable
- D. my-variable

9. Which statement about Python variables is correct?

- A. A variable must be declared with its data type before use
- B. Python variables are dynamically typed
- C. All variables must contain only integers
- D. Variables cannot change their data type

10. Which of the following is a Python keyword?

- A. value
- B. number
- C. def
- D. variable

11.What is the purpose of Python keywords?

- A. They are predefined words with special meaning in Python
- B. They are used only for storing values
- C. They are user-defined functions
- D. They are used only for comments

12. What is lexical analysis in Python?

- A. Executing Python instructions
- B. Breaking source code into tokens
- C. Converting machine code into Python code
- D. Allocating memory to variables

13. Which of the following is an example of a Python token?

- A. Keyword
- B. Identifier
- C. Operator
- D. All of the above

14. What is parsing in Python?

- A. Converting source code into machine code directly
- B. Checking the grammatical structure of the code according to Python's syntax
- C. Storing variables in memory
- D. Printing the program output

15. What is generally produced after Python source code is compiled?

- A. .exe file
- B. .java file

- C. Bytecode
- D. .html file

16. What is the purpose of a .pyc file?

- A. It stores Python source code
- B. It stores compiled Python bytecode
- C. It stores only comments
- D. It stores Python documentation

17. Where are .pyc files normally stored for imported Python modules?

- A. bin folder
- B. src folder
- C. __pycache__ folder
- D. python_files folder

18. What is the primary role of the Python Virtual Machine (PVM)?

- A. It writes Python source code
- B. It executes Python bytecode
- C. It creates HTML pages
- D. It converts Python into C++ source code

19. Which sequence best represents the general execution process of a Python program?

- A. Source Code → Lexical Analysis → Parsing/Compilation → Bytecode → PVM → Execution
- B. Source Code → PVM → Lexical Analysis → HTML → Execution
- C. Source Code → Machine Code → HTML → PVM
- D. Source Code → Database → Bytecode → Browser

20. Which statement best describes the internal working of Python?

- A. Python always directly converts source code into native machine code before execution
- B. Python source code is processed into bytecode, which is then executed by the Python Virtual Machine
- C. Python programs are executed directly by the web browser
- D. Python does not perform parsing or compilation

21. Which of the following correctly uses the format() method to insert values into a string?

- A. "My name is {}".format("deepika")
- B. "My name is {}".insert("deepika")
- C. "My name is {}".add("deepika")
- D. "My name is {}".input("deepika")

22. Which of the following is an example of an f-string in Python?

- A. name = f"Hello {name}"
- B. name = format"Hello {name}"
- C. name = "Hello" + f(name)
- D. name = string("Hello {name}")

23. Which statement correctly takes multiple integer inputs in a single line?

- A. a, b, c = input()
- B. a, b, c = map(int, input().split())
- C. a, b, c = int(input().split())
- D. a, b, c = input(int).split()

24. What is the purpose of `map(int, input().split())`?

- A. It takes multiple inputs, splits them, and converts each value into an integer
- B. It takes only one character as input
- C. It converts integers into strings
- D. It joins multiple inputs into one string

25. What does the `split()` method do when used with `input()`?

- A. Converts the input directly into integers
- B. Divides the input into multiple strings based on whitespace by default.
- C. Removes all characters from the input
- D. Converts the input into a tuple
